present sequence represents residues 124-135 of the SV40 large present sequence represents residues 124-135 of the SV40 large igen, corresponding to the nuclear localisation signal (NLS). It preferably used as one of the domains in the above conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ш

                                                                                                                                                                                                                                                     in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transgenic animals (as models for human carcinogenesis or disease or for drug testing). Other uses include transforming cells to produce proteins, or transfecting cells in vitro to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from endosomes, without requiring endosomal or lysosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a transporter system for delivering nucleic acid to a cell. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide bequences AA33633-A5652 and peptide sequences AA36633-A5652 are used in the construction of the permission of the sequences and the construction of the permission of the construction of the sequences and the construction of the construction of the construction of the construction of the sequences and the construction of the constructio

Gene-delivery compound is useful for targetted gene delivery for treating diseases by gene therapy. The present sequence is Simian virus 40 (SV40) large Tantigen nuclear localisation signal (NLS) peptide used to prepare SCBP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      residue and nucleic aci

The inventors claim an oligo-peptide-carrier conjugate in which the three moieties are covalently linked to one another. The peptide provides a cleavable linker which is cleaved by enzymes which do no
                                                                                                                                               New covalently linked conjugates of oligo:nucleotide, peptide and carrier - utilising surfactant, poly:amine or targetting ligand as lyso somotropic drug carrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

The ODN-targeting ligand linkage const be stable to serum proteases, yet cleaved by the lysosomal cenzymes in the target cell. The method involves conjugation of an ODN bearing an electrophilic crosslinking gp. to a peptide which bears two nucleophilic gps of differing reactivity. The resulting ODN-peptide conjugate is prepol. to that a nucleophilic handle remains on the peptide. This gp. is used to further attach the lysosomotropic carrier to the peptide portion of the ODN-peptide conjugate. The peptide is therefore aslo used as a heterobifunctional linker. The ODN-peptides decribed as models were not designed for use as cleavable linkers. The model peptides are used to demonstrate that peptide linkers can be selectively cleaved by proteases without affecting the ODN. (Updated on 25-MAR-2003 to correct PN field.)
The conjugate may be described as a series of peptide and chemical domains which may be separated by junctions. Each domain performs a particular cell targetting or a cellular function. Junctional segments are spacer regions that may in some cases allow the incorporation of chemically active moleties or markers. These domains and junctions are assembled on a branched polymer (BP) scaffold. The branching of the peptide is preferably provided by a polylysine construct having free
                                                                                                                       A branched synthetic peptide conjugate is provided which can be designed to bind to a target cell surface receptor to penetrate target cells and to deliver a diagnostic probe or cytotoxic functionality to a desired site of action.
                                                                                                                                                                                                                                             New branched synthetic peptide conjugate - can be designed to bind to a tablet cell surface receptor or to deliver a diagnostic probe or cytotoxic functionality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               branched; conjugate; polylysine; scaffold; nuclear localisation signal; NLS; cytoplasmic translocation signal; CTS; domain; junction; octopeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nuclear localisation signal of the SV40 large T antigen.

scleroderma and systemmine diseases such as treat T-cell mediated autoimmune diseases such architis, myasthenia encephalomyelitis, multiple sclerosis, rheumatoid arthritis, myasthenia gravis, thyroiditis, experimental uveoretinitis and celiac disease of the intestine. Production of edible transgenic plants which synthesise disease-specific autoantigens as CTB fusion proteins provides a convenient, effective, affordable and palatable method for prevention of autoimmune diseases. CTB is included to increase the tolerigenic nature of orally administered antigens. High concentrations of autoantigen can be delivered in a site-specific manner, avoiding the need for repeated administration of large amounts of autoantigen. The need for repeated administration of large amounts of autoantigen. The
                                                                                                                                                                                                                                                                                        The present invention describes a chimeric gene construct (I) comprising a plant promoter operatively associated with DNA coding for: (i) a cholera toxin B subunit (CTB); and (ii) an autoantigen. The chimeric construct is used for expressing an autoantigen in plants, e.g. potato or tomato. The resulting cells and transgenic plants which express the autoantigen are useful as edible vaccines for inducing oral tolerance. Depending on the identity of the autoantigen, the vaccines are useful for suppressing allograft rejection or for treating autoimmune diseases including insulin-dependent diabetes mellitus (IDDM), Addison's disease, scleroderma and systemic lupus erythematosus. In particular the vaccines can treat T-cell mediated autoimmune diseases such as autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New chimeric gene construct for expressing autoantigens in plants, useful for producing edible vaccines to treat autoimmune diseases including insulin-dependent diabetes mellitus -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY49942 standard; peptide; 6 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Microsomal retention signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-FEB-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2000-013245/01

                                        expresses the measies virus antigen. The transgenic plant is used to induce an immune response to an antigen in a subject. Diseases such as canine distemper, rabies, canine hepatitis, parvovirus, feline leukemia, foot and mouth, and fowl cholera may be controlled. More than one antigen can be produced in the DNA vaccine. Availability of the vaccine in an edible form as a constituent of a fruit or vegetable crop will enhance vaccination coverage by providing an inexpensive and relatively heat—stable package for distribution. The present sequence represents a C-terminal endoplasmic reticulum (ER)-retention sequence. This sequence is fused C-terminally to a measles virus hemagglutinin (H) antigen, where the material
                                                                                                                                                                                                                                                                                                                  Transgenic plant for inducing an immune response to an antigen, for treating e.g. measles, canine distemper and feline leukemia, comprises a DNA molecule with a sequence encoding the antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transgenio; measles virus antigen; immune response; canine distemper rabies; canine hepatitis; parvovirus; feline leukemia; fowl cholera; endoplasmic reticulum; hemagglutinin; H antigen; immunostimulant; virucide; anti-HIV; antiprotozoal; cytostatic; antibacterial; vaccin

                                                                                                                                                                                                                                                                                                         The invention relates to human alpha-galactosidase truncated at the carboxy terminus and the production of enzymatically active recombinant human and animal lysosomal enzymes. The invention is useful for producing lysosomal enzymes for treating lysosomal storage diseases, producing altered or mutated proteins, enzymatically active or otherwise, to serve as precursors or substrates for further in vivo or in vitro processing to a specialised industrial form for research or therapeutic uses, to produce more effective therapeutic enzyme, for producing antibodies against lysosomal enzymes for medical diagnostic use, and in any commercial process that involves substrate hydrolysis. The present sequence is rice ER retention signal peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rice ER retention signal peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human alpha-galactosidase polypeptide useful for treating lysosomal storage diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human IgM phage display library using EGFR as antigen. Two isolates with different amino acid sequences were identified. The anti-EGFR-screy are useful for treating cancer, and for the diagnostic location and assessment of tumour growth, where the anti-EGFR-scFV is radiolabelled. The present sequence representing an endoplasmic reticulum retention signal can be used to target scFvs

Gene-delivery compound is useful for targetted gene delivery for treating diseases by gene therapy. The present sequence is endoplasmic reticulum (ER) retention signal peptide used to prepare SCBP fusion construct.
                                                                                                                                                                                                                                                                                                            Glucocerebrosidase;
                                                                                                                                                                                                                                                                                                                                   ER-retention signal peptide.
                                                                                                                                                                                                                                                                                                                                                                                   AAE19268;
                                                                                                                                                                                                                                                                                                                                                                                                       AAE19268 standard;

        (b) optionally a J chain and secretory component associated with the chimeric ICAM-1 molecule. The immunoadhesin has plant-specific glycosylation and virucide activity. The immunoadhesin is useful for reducing infection by human rhinovirus (HRV) and hence the initiation or spread of the common cold by HRV. The immunoadhesin binds to HRV and reduces its infectivity, competing with cell surface ICAM-1 for binding sites, interfering with virus entry or uncoating and directing premature release of viral RNA and formation of empty capsids. Expression of the immunoadhesin in plants would be tetrameric, rather than dimeric. Immunoadhesin having multiple binding sites have a higher effective affinity for the virus, thereby increasing the effectiveness of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     glucocerebrosidase and alpha-galactosidase having a post-translational modification. The enzymes are useful in enzyme replacement therapy for treating lyosomal storage diseases (e.g. Gaucher disease, Niemann-Pick disease, Fabry disease and Tay-Sachs disease), in researches for developing new approaches to medical treatment of lyosomal storage diseases and in industrial processes involving enzymatic substrate hydrolysis. The present sequence is ER-retention signal peptide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                              Immunoadhesin for treating human rhinovirus infection comprises chimeric intercellular adhesion molecule-1, and optionally a J and secretory component in association

                                                                                   The present invention relates to a stable plastid transformation and expression vector for stably transforming a plastid genome. The vector can be used to stably transform a plant for the expression of heterologous genes e.g. insulin, cholera toxin beta, interferon gene, insulin-like growth factor gene, a human serum albumin (HSA) gene, or a biopolymer fusion gene. The vector can be used to produce edible tobacco, or alfalfa plants. By producing the heterologous genes in an edible plant, the proteins can be orally delivered to patients that require them, e.g. insulin to diabetics, without the need for injections. The present sequence is an endoplasmic reticulum retention signal. This peptide was used to illustrate the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chain increases the stability of the immunoadhesin in the mucosal environment. Production is significantly less expensive in plants than animal cell culture and production in plants is safer for human use, since plants are not known to harbor any animal viruses. The present sequence is that of a plant endoplasmic reticulum (ER) retention signal
                                                                                                                                                                                                                                                                                                                                                                                                                               (AUBU )

                                                                         S
                                                                                                       glycosylation and virucide activity. The immunoadhesin is useful for creducing infection by human rhinovirus (HRV) and hence the initiation or spread of the common cold by HRV. The immunoadhesin binds to HRV and creduces its infectivity, competing with cell surface ICAM-1 for binding reduces its infectivity, competing with cell surface ICAM-1 for binding sites, interfering with virus entry or uncoating and directing premature release of viral RNA and formation of empty capsids. Expression of the immunoadhesin in plants would be tetrameric, rather than dimeric. Immunoadhesin having multiple binding sites have a higher effective affinity for the virus, thereby increasing the effectivence immunoadhesin. Association of secretory component and immunoglobulin J chain increases the stability of the immunoadhesin in the mucosal cenvironment. Production is significantly less expensive in plants than in cell culture and production in plants is safer for human use, since plants are not known to harbor any animal viruses. The present sequence is that of a plant endoplasmic reticulum (ER) retention signal.

                                                                                                                                                                                                                                                            heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence is a detectably labeled peptide which binds the erd 2 receptor may be determined by measuring the ability of the inhibitor to compete with this labeled peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        oligomerisation domain; neoplasia; sarcoma; lymphoma; leukaemia; melanoma; carcinoma; glioblastoma; astromytoma; oncogene; infectious disease; allergy; autoimmune disease; erd 2 receptor.

The method provides an inexpensive production and delivery system for such antigens to animals. This is the LT-B Escherichia coli toxin subunit C-terminal peptide modified to also comprise a SEKDEL microsomal retention signal. The sequence coding for the whole LT-B gene was used in the construction of such a transgenic plant. The immunogenic agent preferably comprises the LT-B or CT-B (cholera toxin B subunit) or
            Measles virus.
Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  comprising a sequence encoding a measles virus antigen so that the plant expresses the measles virus antigen. The transgenic plant is used to induce an immune response to an antigen in a subject. Diseases such as canine distemper, rabies, canine hepatitis, parvovirus, feline leukemia, foot and mouth, and fowl cholera may be controlled. More than one antigen can be produced in the DNA vaccine. Availability of the vaccine in an edible form as a constituent of a fruit or vegetable crop will enhance vaccination coverage by providing an inexpensive and relatively heat-stable package for distribution. The present sequence represents a C-terminal sequence of a modified measles virus hemaggluthin (H) antigen, used in the construction of transgenic tobacco plants producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transgenic plant for inducing an immune response to an antige treating e.g. measles, canine distemper and feline leukemia, a DNA molecule with a sequence encoding the antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human alpha-galactosidase truncated at the carboxy terminus and the production of enzymatically active recombinant human and animal lysosomal enzymes. The invention is useful for producing lysosomal enzymes for treating lysosomal storage diseases, producing altered or mutated proteins, enzymatically active or otherwise, to serve as precursors or substrates for further in vivo or in vitro processing to a specialised industrial form for research or therapeutic uses, to produce more effective therapeutic enzyme, for producing antibodies against lysosomal enzymes for medical diagnostic use, and in any commercial process that involves substrate hydrolysis. The present sequence is Tobacco mosaic virus rGAL-12R peptide.
                                                                                                                                                                                                                                                                                                                                                   Glucocerebrosidase; alpha-galactosidase; Tay-Sachs disease; plant; enzyme replacement therapy; Niemann-Pick disease; Gaucher disease; Fabry disease; lysosomal storage disease; human.
                                                               New glucocerebrosidase and alpha-galactosidase having a post-translational modification, useful in enzyme replacement therapy for treating lysosomal storage diseases, e.g. Gaucher disease, Niemann-Pick disease, Fabry disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel human alpha-galactosidase polypeptide useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   glucocerebrosidase and alpha-galactosidase having a post-translational modification. The enzymes are useful in enzyme replacement therapy for treating lysosomal storage diseases (e.g. Gaucher disease, Niemann-Pick disease, Fabry disease and Tay-Sachs disease), in researches for developing new approaches to medical treatment of lysosomal storage diseases and in industrial processes involving enzymatic substrate hydrolysis. The present sequence is human alpha-galactosidase C-terminal
                                                                                                                                                                       The invention relates to human alpha-galactosidase truncated at the carboxy terminus and the production of enzymatically active recombinant human and animal lysosomal enzymes. The invention is useful for producing lysosomal enzymes for treating lysosomal storage diseases, producing altered or mutated proteins, enzymatically active or otherwise, to serve as precursors or substrates for further in vivo or in vitro processing to a specialised industrial form for research or therapeutic uses, to produce more effective therapeutic enzyme, for producing antibodies against lysosomal enzymes for medical diagnostic use, and in any commercial process that involves substrate hydrolysis. The present sequence is Tobacco mosaic virus rGAL-25R vector peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Garger SJ,

                                                                                                                                                                                          modification. The enzymes are useful in enzyme replacement therapy for treating lysosomal storage diseases (e.g. Gaucher disease, Niemann-Pick disease, Fabry disease and Tay-Sachs disease), in researches for developing new approaches to medical treatment of lysosomal storage diseases and in industrial processes involving enzymatic substrate hydrolysis. The present sequence is human recombinant alphagalactosidase-A C-terminal modified peptide.
                                                                                                                                                                                                                                                                                     The invention relates to production of lysosomal enzymes in plants by transient expression. The invention particularly relates to glucocerebrosidase and alpha-galactosidase having a post-translational

The invention relates to the ability of novel oligomeric conjugates, such as histidylated oligolysine (see also AAY95255 and AAY95256), to transfer small biological molecules into cells. The novel oligomeric conjugates contain an oligomer with a polymerization degree (PD) of 5-50, preferably 10-40, and more preferably 20, formed from monomeric components having free NH3+ in a number equal to or higher than 50% of the PD. The oligomeric conjugates induce a membrane destabilization at acidic pH allowing the transfer of biological molecules to the cytoplasm or cell nucleus in vitro, in vivo or exvivo. Suitable biological molecules are antisense, triplex-forming
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligomeric conjugate; peptide transfer; graft rejection; allergy; inflammation; infection; antitumour; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for inhibiting the formation of aggregates of certain proteins, involving contacting the protein with a binding molecule known as an intrabody. Proteins to be bound include those associated with neurological disorders, and so the method can be used in the prevention of diseases such as Alzheimer's, Parkinson's and Huntington's diseases, prion disease, frontotemporal dementia, amyotrophic lateral sclerosis, spinal and bulbar muscular atrophy, dentatorubal-pallidoluysian atrophy, spinocerebellar ataxia type 1 (SCA1), SCA2, SCA3, SCA4, SCA5, SCA6 and SCA7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting intracellular polypeptide accumulation, useful for treating neurological disorders, e.g. Alzheimer's disease, comprises contacting the polypeptide with a specific intrabody -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (HUST/)

The invention particularly relates to glucoccerebrosidase and alpha-galactosidase having a post-translational modification. The enzymes are useful in enzyme replacement therapy for treating lysosomal storage diseases (e.g. Gaucher disease, Niemann-Pick disease, Fabry disease and Tay-Sachs disease), in researches for developing new approaches to medical treatment of lysosomal storage diseases and in industrial processes involving enzymatic substrate hydrolysis. The present sequence is human recombinant alphagalactosidase-A C-terminal modified peptide.
                                                                                                                                                                                                                                                                                                 Glucocerebrosidase; alpha-galactosidase; Tay-Sachs disease; plant; enzyme replacement therapy; Niemann-Pick disease; Gaucher disease; Fabry disease; lysosomal storage disease; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 11;

The invention relates to production of lysosomal enzymes in plants by transient expression. The invention particularly relates to glucocerebrosidase and alpha-galactosidase having a post-translational modification. The enzymes are useful in enzyme replacement therapy for treating lysosomal storage diseases (e.g. Gaucher disease, Niemann-Pick disease, Pabry disease and Tay-Sachs disease), in researches for developing new approaches to medical treatment of lysosomal storage diseases and in industrial processes involving enzymatic substrate hydrolysis. The present sequence is human recombinant alphagalactosidase-A C-terminal modified peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to production of lysosomal enzymes in plants by transient expression.                                                                                                                                                                         The invention relates to production of lysosomal enzymes in plants by transient expression. The invention particularly relates to glucoccerebrosidase and alpha-galactosidase having a post-translational modification. The enzymes are useful in enzyme replacement therapy for treating lysosomal storage diseases (e.g. Gaucher disease, Niemann-Pick disease, Fabry disease and Tay-Sachs disease), in researches for developing new approaches to medical treatment of lysosomal storage diseases and in industrial processes involving enzymatic substrate hydrolysis. The present sequence is human recombinant alphagalactosidase-A r(Gal-AR) C-terminal peptide.

cc shock proteins more accessible to the immune system and improves immune capponse to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has cat its carboxy terminus a region which binds to a KDEL receptor. The ctarget antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and castromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present cleavable signal peptide; the oligomerisation domain of human cleavable signal peptide; the oligomeric matrix protein which provides concreased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                         The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat
                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibitors of the KDEL receptor which comprises an oligomerization domain useful for promoting secretion of proteins which are normally retained within the cell \, -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligomerisation domain; neoplasia; sarcoma; lymphoma; leu melanoma; carcinoma; glioblastoma; astromytoma; oncogene;

                                                                                                                       CC proteins given in ABP00010 to ABP11500. OFFX proteins are useful for CC treating or preventing a pathology associated with an OFFX-associated CC disorder in humans, and in the manufacture of a medicament for treating a CC syndrome associated with OFFX-associated disorder. OFFX polynucleotide CC sequences can be used in gene therapy. OFFX sequences can be used in the CC treatment of cancer, hyperproliferative disorders, cirrhosis of liver, CC psoriasis, benign tumours, keloid, degenerative disorders related to organ transplantation, cardiovascular diseases, disorders related to organ CC tupus erythematosus, hypertension, hypothyroidism, cholesterol ester CC storage disease, various immune deficiencies and disorders, infectious CC diseases, autoimmune disorders such as multiple sclerosis, rheumatoid carthritis, autoimmune inflammatory eye disease. OFFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, CC useful for treating burns, incisions, ulcers, for treating osteoporosis, conception or regeneration and treatment of lung or liver fibrosis, consistency cytokine damage.

CC NB The degeneration and treatment of lung or liver fibrosis, consistency of the consist of the consistency of the consist of the con

The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sercoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromyroma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present
                                                                                                                                                                                                                                                                                              Disclosure; Fig 3; 87pp; English.

The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        KDEL receptor inhibitor; heat shock protein; immune response; oligomerisation domain; neoplasia; sarcoma; lymphoma; leukaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY44961;
  The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell sues theat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted

The present sequence is KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of mouse thrombospondin 3 (TSP3) trimerisation domain including an additional subsequence; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.

The inhibitor protein comprises several subunits where each subunit comprises an oligomerization domain and has at its carboxy terminus a region which binds to a KDEL receptor. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    heat shock proteins by inhibiting KDEL receptor-mediated return of CD protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune cresponse to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has cat its carboxy terminus a region which binds to a KDEL receptor. The CC target antigen may be associated with diseases including neoplasia such a stromytoma, lukemia, melanoma, carcinoma, glioblastoma and castromytoma, with defective tumour suppressor genes, oncogenes, confectious diseases, allergy or autoimmune diseases. The present CC sequence is KDEL receptor inhibitor comprising regions encoding a CC thrombospondin 4 (TSP4) trimerisation domain including an additional CC thrombospondin (TSP4) trimerisation domain including an additional CC thrombospondin 4 (TSP4) trimerisation domain including an additional CC thrombospondin 4 care light inker domain and the carboxy-terminal sequence CC KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The present sequence is KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of human cartilage oligomeric matrix protein (COMP) pentamerisation domain; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat COMP which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                         response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US-09-328-352-7414
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 7414, Application US/09328352
Patent No. 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUWANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 7414
LENGTH: 197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Patent No.
